

The Intake System

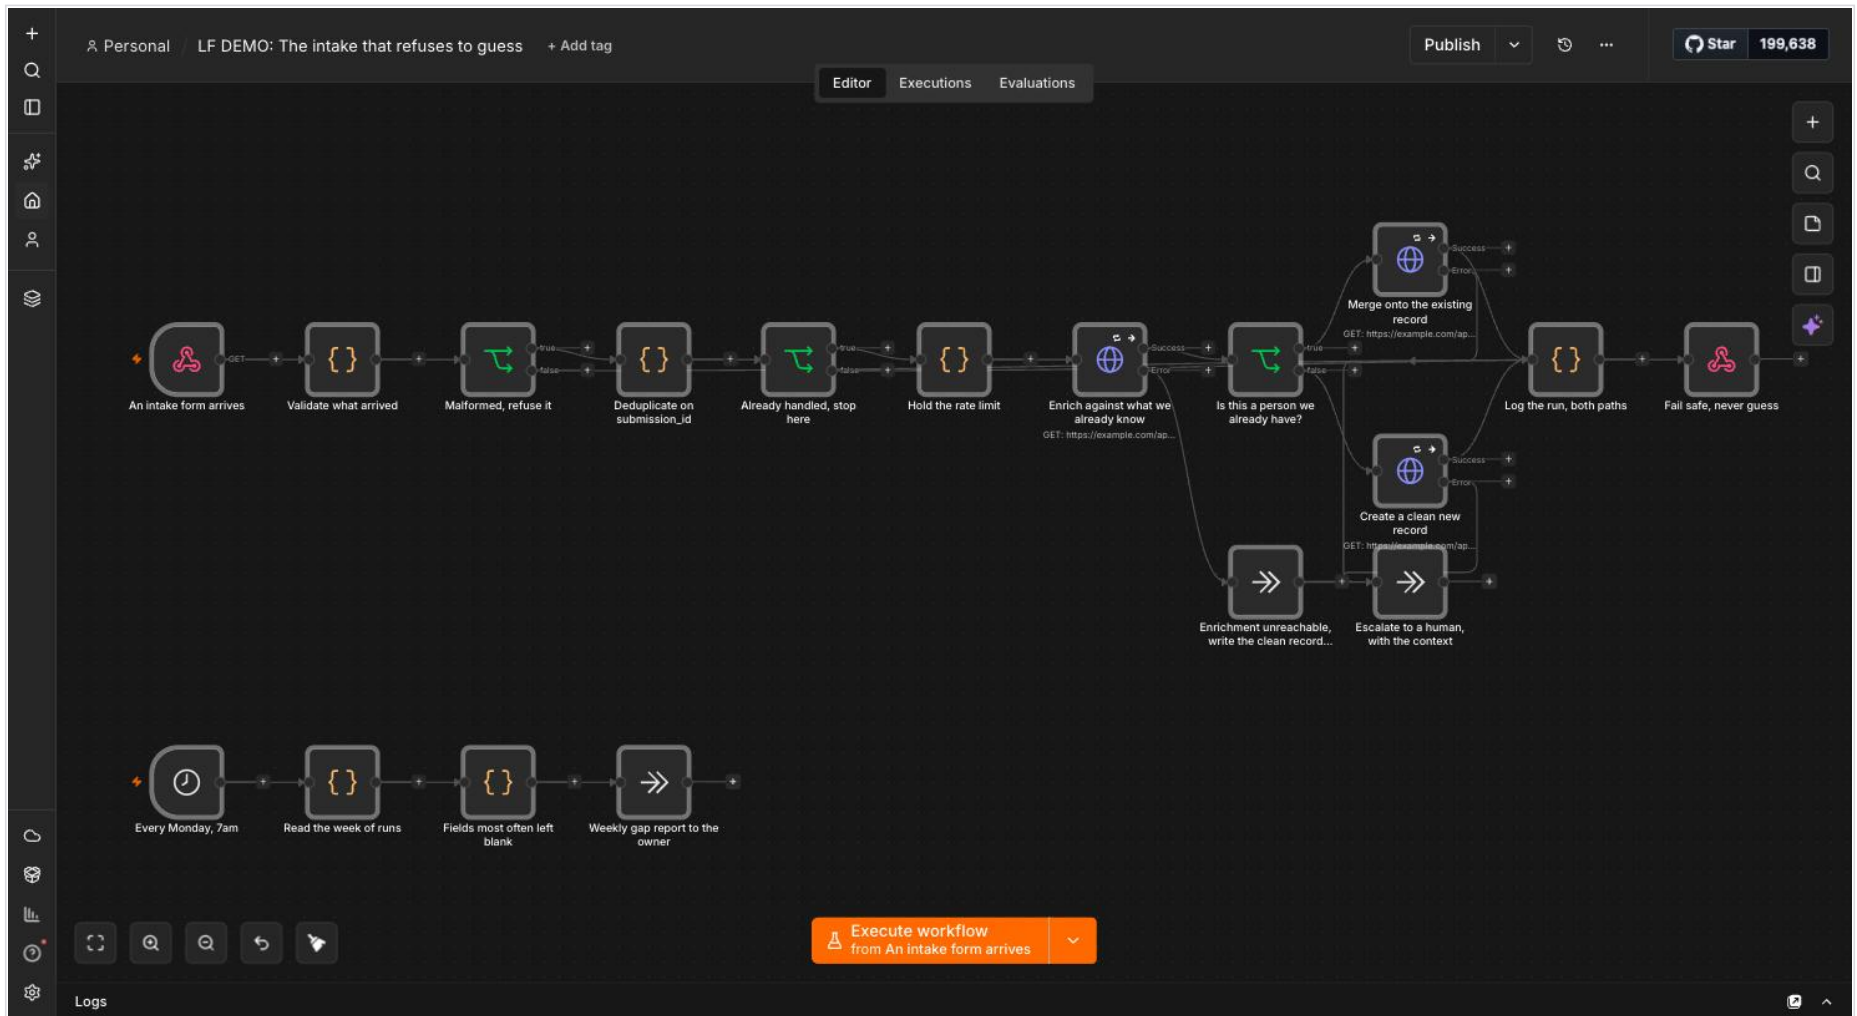

data-collection · built in stripe

A half-record in the CRM is worse than no record, because it looks complete.

What it connects to: The form and the system of record are almost never the same tool. Everything expensive happens in the gap: duplicates, half-records, and fields that mean different things on each side.

1 of 4 SYSTEM

Here's the intake spine: validate, refuse what's malformed, dedupe, then write a clean record.

2 of 4 THINKING

The validation gate is the part that matters — it refuses rather than guessing.

The screenshot displays a workflow editor interface with a dark theme. The main workspace is divided into three vertical panels: INPUT, CONFIGURATION, and OUTPUT.

- INPUT Panel:** Contains the text "No input data" and a button labeled "Execute previous nodes" with the subtitle "to view input data".
- CONFIGURATION Panel:** Features a tabbed interface with "Parameters" and "Settings" tabs. The "Parameters" tab is active, showing a "Conditions" section with a JSON-based condition: `{{ $json.existing === true && $json.confidence > 0.8 }}`. A dropdown menu next to it is set to "is true". Below the conditions, there is a toggle switch for "Convert types where required" (currently off) and an "Options" section with an "Add option" button. An "Execute step" button is located at the top right of this panel.
- OUTPUT Panel:** Contains the text "No output data" and a button labeled "Execute step" with the subtitle "to view output data".

At the bottom of the interface, there is a "Logs" section and a footer area with a question mark icon and the text "I wish this node would...".

The intake form itself, with real field types bound to CRM properties.
