

The Migration Build

platform-migration · built in hubspot

Migrations lose records quietly. Nobody finds out until the customer who was lost calls.

What it connects to: Migration is two data models arguing. The mapping decision — which field becomes which property — is the entire job; the import is the easy part.

1 of 4 SYSTEM

Here's the migration: reversible batches, counts reconciled before anything commits.

2 of 4 THINKING

If the counts don't match, the batch rolls back and reports the delta instead of half-writing.

The screenshot shows a workflow editor with a central node titled "Do the counts reconcile exactly?". The node has three tabs: "Parameters", "Settings", and "Docs". The "Parameters" tab is active, showing a "Conditions" section with a single condition: `{{ $json.countsMatch === true && $json.sourceCount > 0 }}`. Below the conditions is a toggle for "Convert types where required" which is currently off. There is also an "Options" section with a "+ Add option" button. The "INPUT" panel on the left shows "No input data" and a button "Execute previous nodes" with the text "to view input data" below it. The "OUTPUT" panel on the right shows "No output data" and a button "Execute step" with the text "to view output data" below it. At the bottom of the node configuration area, there is a text input field with the placeholder "I wish this node would...". The bottom of the interface has a "Logs" tab and a small icon.

Do the counts reconcile exactly?
