

The Research Desk

ai-research-agent · built in n8n

An agent that researches is easy. An agent that can show you where every sentence came from is the one you can actually put in front of a client.

What it connects to: The model is a renter, not an owner. The sources live on the web, the output has to land in something a person opens, and the agent is only the middle.

1 of 3 SYSTEM

Here's the research pass — question in, live sources fetched, brief out, and the sources kept.

2 of 3 THINKING

This is the gate that makes it usable: if a claim is not backed by something it actually fetched, it does not go in the brief. It says what it does not know instead.

The screenshot displays a workflow editor with a dark theme. The main workspace is divided into three vertical panels: INPUT, CONFIGURATION, and OUTPUT.

- INPUT Panel:** Contains a message "No input data" and a button "Execute previous nodes" with the text "to view input data" below it.
- CONFIGURATION Panel:** Has tabs for "Parameters" and "Settings".
 - Conditions:** A dropdown menu shows a JSON-based condition: `{{ $json.allClaimsCited == true && $json.sources.length >= 3 }}`. To its right is a checkbox labeled "is true". Below this is a "+ Add condition" button.
 - Options:** A toggle switch for "Convert types where required" is currently off. Below it is a "+ Add option" button.
 - Fixed Expression:** A button with a vertical ellipsis icon and the text "Fixed Expression".
- OUTPUT Panel:** Labeled "OUTPUT" at the top, it is currently empty.

At the top of the editor, a green icon and the text "Is every claim backed by a source we fetched?" indicate the current node's function.

3 of 3 RESULT

And the weekly scorecard: how many answers needed a human, and how thin the sourcing was when they did. Depth measured in sources actually read, not in output length.
