

The Lead Router

lead-routing · built in zapier

Five minutes is the whole game. A lead that waits an hour is worth a fraction of one answered fast.

What it connects to: The form is in one system, the owner roster in another, and the SLA clock in neither. The clock is the integration.

1 of 4 SYSTEM

Here's the routing system end to end — score, assign, contact, and escalate on silence.

2 of 4 THINKING

The part most builds miss is the SLA timer: this reassigns when the first owner doesn't touch it.

Is this one worth the fast lane?

3 of 4 THEIR-WORLD

Same pattern running inside a real CRM, with the merge fields and the branch on lead source.

The screenshot displays the Zapier workflow editor. The main workspace shows a workflow with two steps:

- 1. Catch Hook** (Webhooks by Zapier)
- 2. Filter conditions** (Filter by Zapier)

The right-hand panel, titled **2. Filter conditions**, shows the configuration for the filter step:

- Setup** and **Configure & test** tabs are visible.
- Only continue if** rule group:
 - 1. Status (Text) Exactly matches qualified
- And** rule group:
 - 1. Lead Score (Number) Greater than 50
- A green message box states: "Your zap would have continued. If your Zap did not continue as expected, [edit your filter below](#) and retest."
- A **Continue** button is at the bottom.

The bottom of the interface shows a **Library** section and a version number: **ver. v2026-08-07T11:36-19111377**.

4 of 4 MORE

And the segmentation behind it, so the right leads reach the right closer.
