

The Intake System

data-collection · built in instantly

A half-record in the CRM is worse than no record, because it looks complete.

What it connects to: The form and the system of record are almost never the same tool. Everything expensive happens in the gap: duplicates, half-records, and fields that mean different things on each side.

1 of 4 SYSTEM

Here's the intake spine: validate, refuse what's malformed, dedupe, then write a clean record.

2 of 4 THINKING

The validation gate is the part that matters — it refuses rather than guessing.

The screenshot displays a workflow editor interface with a dark theme. The main workspace is divided into three vertical panels: INPUT, PARAMETERS, and OUTPUT.

- INPUT Panel:** Contains the text "No input data" and a button labeled "Execute previous nodes" with the subtitle "to view input data".
- PARAMETERS Panel:** Features a tabbed interface with "Parameters" and "Settings" tabs. The "Parameters" tab is active, showing a "Conditions" section with a text area containing the JSON condition: `{{ $json.existing === true && $json.confidence > 0.8 }}`. To the right of the text area is a dropdown menu with "is true" selected. Below the conditions section is a toggle switch labeled "Convert types where required" which is currently turned off. At the bottom of the parameters section is an "Options" section with a "+ Add option" button.
- OUTPUT Panel:** Contains the text "No output data" and a button labeled "Execute step" with the subtitle "to view output data".

At the top of the workspace, there is a title bar with a green icon and the text "Is this a person we already have?". On the right side of the title bar are "Docs" and "X" icons. At the bottom of the workspace, there is a "Logs" panel and a status bar with the text "I wish this node would..." and a help icon.

The intake form itself, with real field types bound to CRM properties.
