

The Operations Board

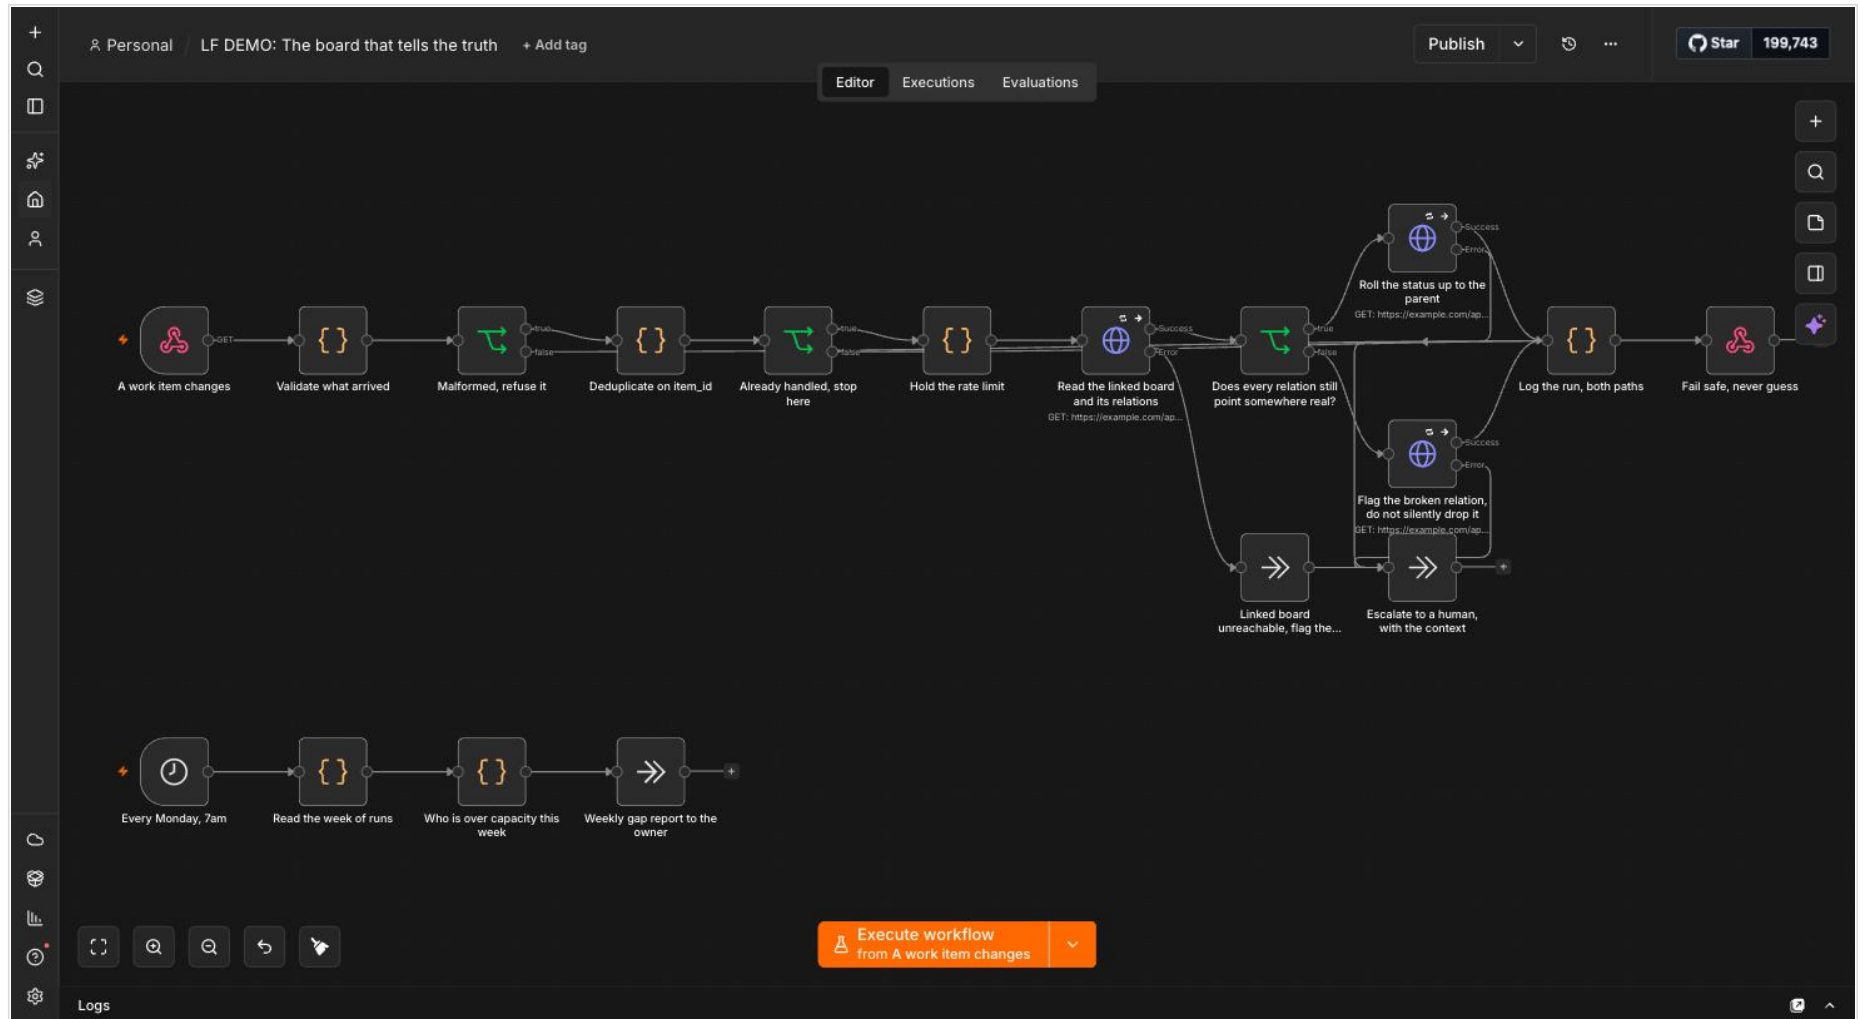

project-ops · built in monday

Most board problems are architecture problems: relations pointing at dead boards, no templates, and no way to see who is drowning.

What it connects to: The board is downstream of the CRM and upstream of the invoice. Work arriving without its deal context is what makes a board go stale.

1 of 4 SYSTEM

Here's the system that keeps the boards honest — it checks the structure on every change rather than waiting for someone to notice a broken column.

2 of 4 THINKING

This is the gate underneath it: a relation pointing at a board that no longer exists gets flagged, not silently dropped. Silently dropped is how boards rot.

Does every relation still point somewhere real?

Backlog

How can I help?

And the workload view, which is the answer to 'we can't see who's overloaded'.
