

The Reporting Layer

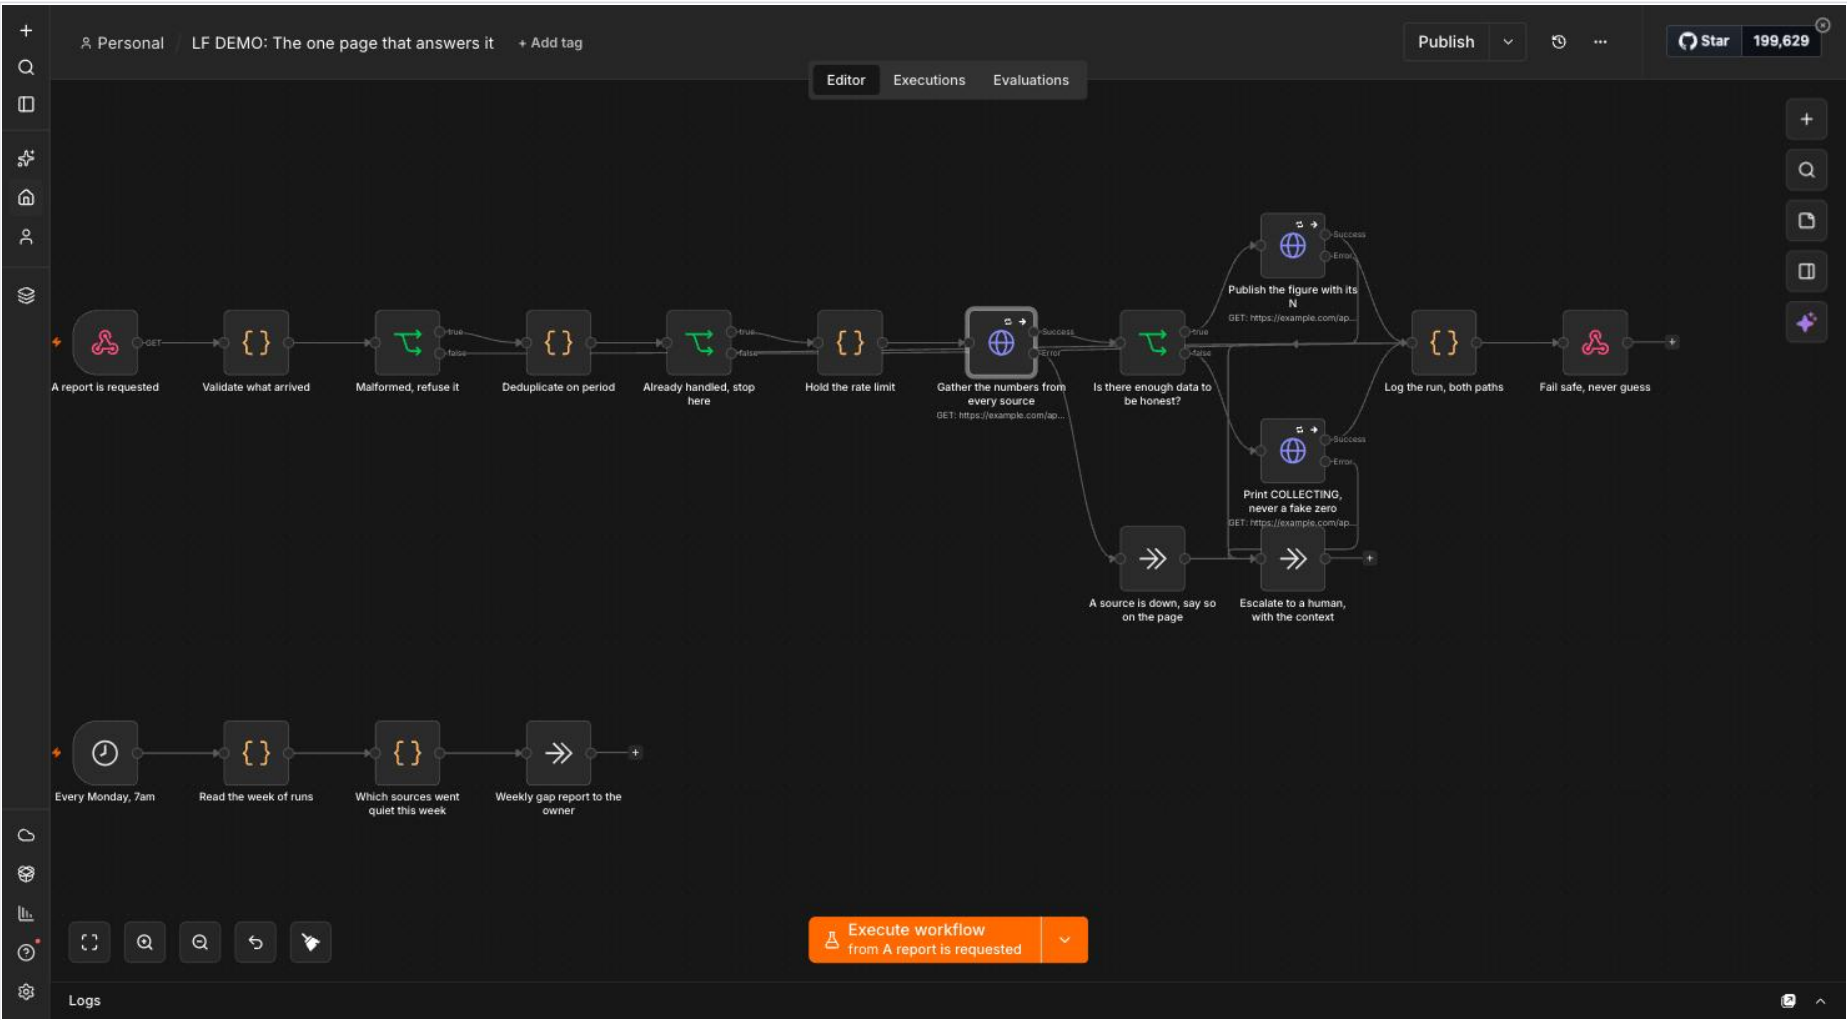

reporting · built in google-sheets

Most dashboards lie by omission. A zero that means 'unknown' looks exactly like a zero that means zero.

What it connects to: Every source counts a lead slightly differently. The reporting layer is where you decide, once and in writing, whose definition wins.

1 of 4 SYSTEM

Here's the system that gathers from every source and only publishes once there's enough data to be honest.

2 of 4 THINKING

Below the threshold it prints COLLECTING rather than a number that reads as fact.

 Is there enough data to be honest?

INPUT

ParametersSettings

Execute step

Conditions

fx

`{{ $json.n >= 30 && $json.sourcesRead == $json.sourcesExpected }}`

+ Add condition

☐ is true

Convert types where required

Options

+ Add option

→|

3 of 4 THEIR-WORLD

The reporting layer running live on real records.

SAMPLE - Job Intake and Bulk Order Automation

+ ≡ Intake Bulk Order Log

4 of 4 RESULT

And the same layer on a second stack — the numbers move, the structure does not.

The screenshot shows the Google Apps Script editor interface. The title bar reads "Apps Script Job Intake and Bulk Order Aut...". On the right, there is a "Deploy" button and a user profile icon labeled "S". The left sidebar contains a "Files" panel with "Code.gs" selected, and "Libraries" and "Services" sections with plus signs. The main editor area displays JavaScript code with line numbers 129 through 162. The code implements a deduplication and aggregation process. It starts with a loop that skips rows where jobId is missing or the row is not complete. Then, it deduplicates rows based on jobId. Next, it groups rows by a key composed of supplier and service, aggregating quantity, total, and job counts. Finally, it maps the aggregated groups into an output array.

```
129     if (!jobId || !isRowComplete_(row)) { skipped++; continue; }
130
131     if (seen[jobId]) { duplicates++; continue; } // <-- dedupe
132     seen[jobId] = true;
133     unique.push(row);
134 }
135
136 // --- Pass 2: group + sum by Supplier / Service -----
137 var groups = {}; // key -> aggregate
138 var order = []; // preserves first-seen ordering
139
140 for (var j = 0; j < unique.length; j++) {
141     var r = unique[j];
142     var service = String(r[COL.SERVICE - 1]).trim();
143     var supplier = SERVICE_SUPPLIER[service] || 'UNMAPPED - review';
144     var qty = Number(r[COL.QTY - 1]) || 0;
145     var total = qty * (Number(r[COL.UNIT_PRICE - 1]) || 0);
146     var key = supplier + '||' + service;
147
148     if (!groups[key]) {
149         groups[key] = { supplier: supplier, service: service,
150             qty: 0, total: 0, jobs: 0 };
151         order.push(key);
152     }
153     groups[key].qty += qty;
154     groups[key].total += total;
155     groups[key].jobs += 1;
156 }
157
158 // --- Pass 3: write -----
159 var out = order.map(function (key) {
160     var g = groups[key];
161     return [g.supplier, g.service, g.qty, g.jobs, g.total,
162         g.qty ? g.total / g.qty : 0];
163 }
```
