

The Watch

alerting · built in airtable

Something breaks silently and the business hears it from a customer. That's the most expensive way to find out.

What it connects to: The thing that breaks and the thing that tells you are never the same system, and the watchdog must not depend on the system it is watching.

1 of 4 SYSTEM

Here's the watchdog, with the exact fix carried inside the alert rather than just the symptom.

2 of 4 THINKING

It's tested against a planted failure before it ever watches anything real — an alert nobody trusts gets muted.

The screenshot shows a workflow editor interface for a node titled "Is it genuinely stalled, or just slow?". The interface is divided into three main sections: INPUT, Parameters, and OUTPUT.

INPUT Section: Displays "No input data" with a button "Execute previous nodes" and the text "to view input data".

Parameters Section: Contains a "Conditions" field with a JSON expression: `{{ $json.stalled === true && $json.minutesSince > $json.threshold }}`. A dropdown menu next to it shows "is true". Below the conditions field is a button "+ Add condition". There is also a toggle switch for "Convert types where required" which is currently turned off. Below the toggle is an "Options" section with a button "+ Add option". An orange button "Execute step" is located at the top right of the Parameters section.

OUTPUT Section: Displays "No output data" with a button "Execute step" and the text "to view output data".

Footer: A "Logs" tab is visible at the bottom left. A feedback prompt at the bottom center says "I wish this node would...".

3 of 4 THEIR-WORLD

The alerting path in the CRM, escalating with context.
