

The Approval Router

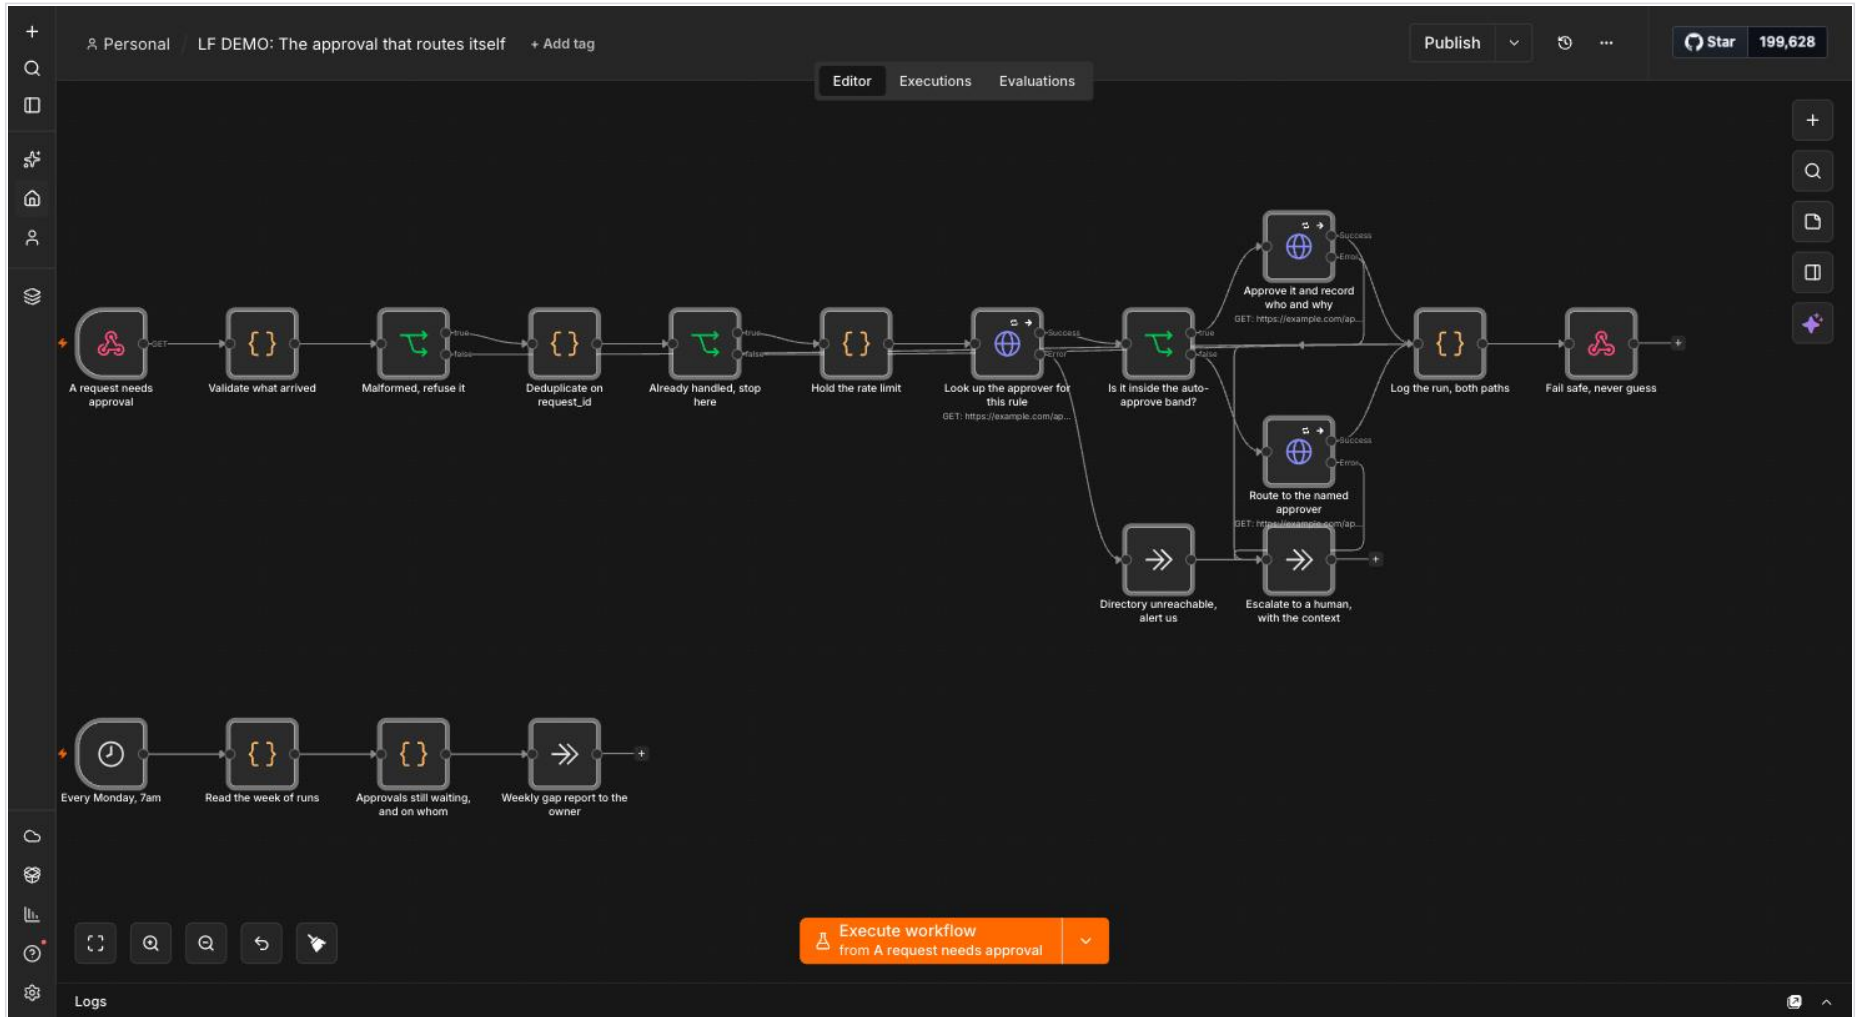

approval-routing · built in airtable

Approvals sit in an inbox with no ladder, so the bottleneck is invisible until someone asks why nothing shipped.

What it connects to: The request arrives in one place and the authority to approve lives in another. The audit trail has to span both or the band is unauditably.

1 of 4 SYSTEM

Here's the router: auto-approve inside a band, route the rest by rule, escalate on silence.

2 of 4 THINKING

Every auto-approval records who and why, or the band becomes unauditale.

The screenshot shows a workflow editor interface with a dark theme. The central node is titled "Is it inside the auto-approve band?". It has two tabs: "Parameters" (selected) and "Settings". In the "Parameters" tab, there is a "Conditions" section with a single condition: `{{ $json.withinBand === true && $json.approver != null && $json.amount > 0 }}`. To the right of the condition is a dropdown menu showing "is true". Below the conditions is a toggle switch for "Convert types where required" which is currently turned off. There is also an "Options" section with a "+ Add option" button. An orange "Execute step" button is located in the top right of the node's configuration area. The interface is divided into three main panels: "INPUT" on the left, the central configuration area, and "OUTPUT" on the right. The "INPUT" panel shows "No input data" and a button "Execute previous nodes" with the text "to view input data" below it. The "OUTPUT" panel shows "No output data" and a button "Execute step" with the text "to view output data" below it. At the bottom of the interface, there is a "Logs" tab and a suggestion text: "I wish this node would...".

3 of 4 THEIR-WORLD

The stage and approval configuration inside a real CRM.
