

The Intake System

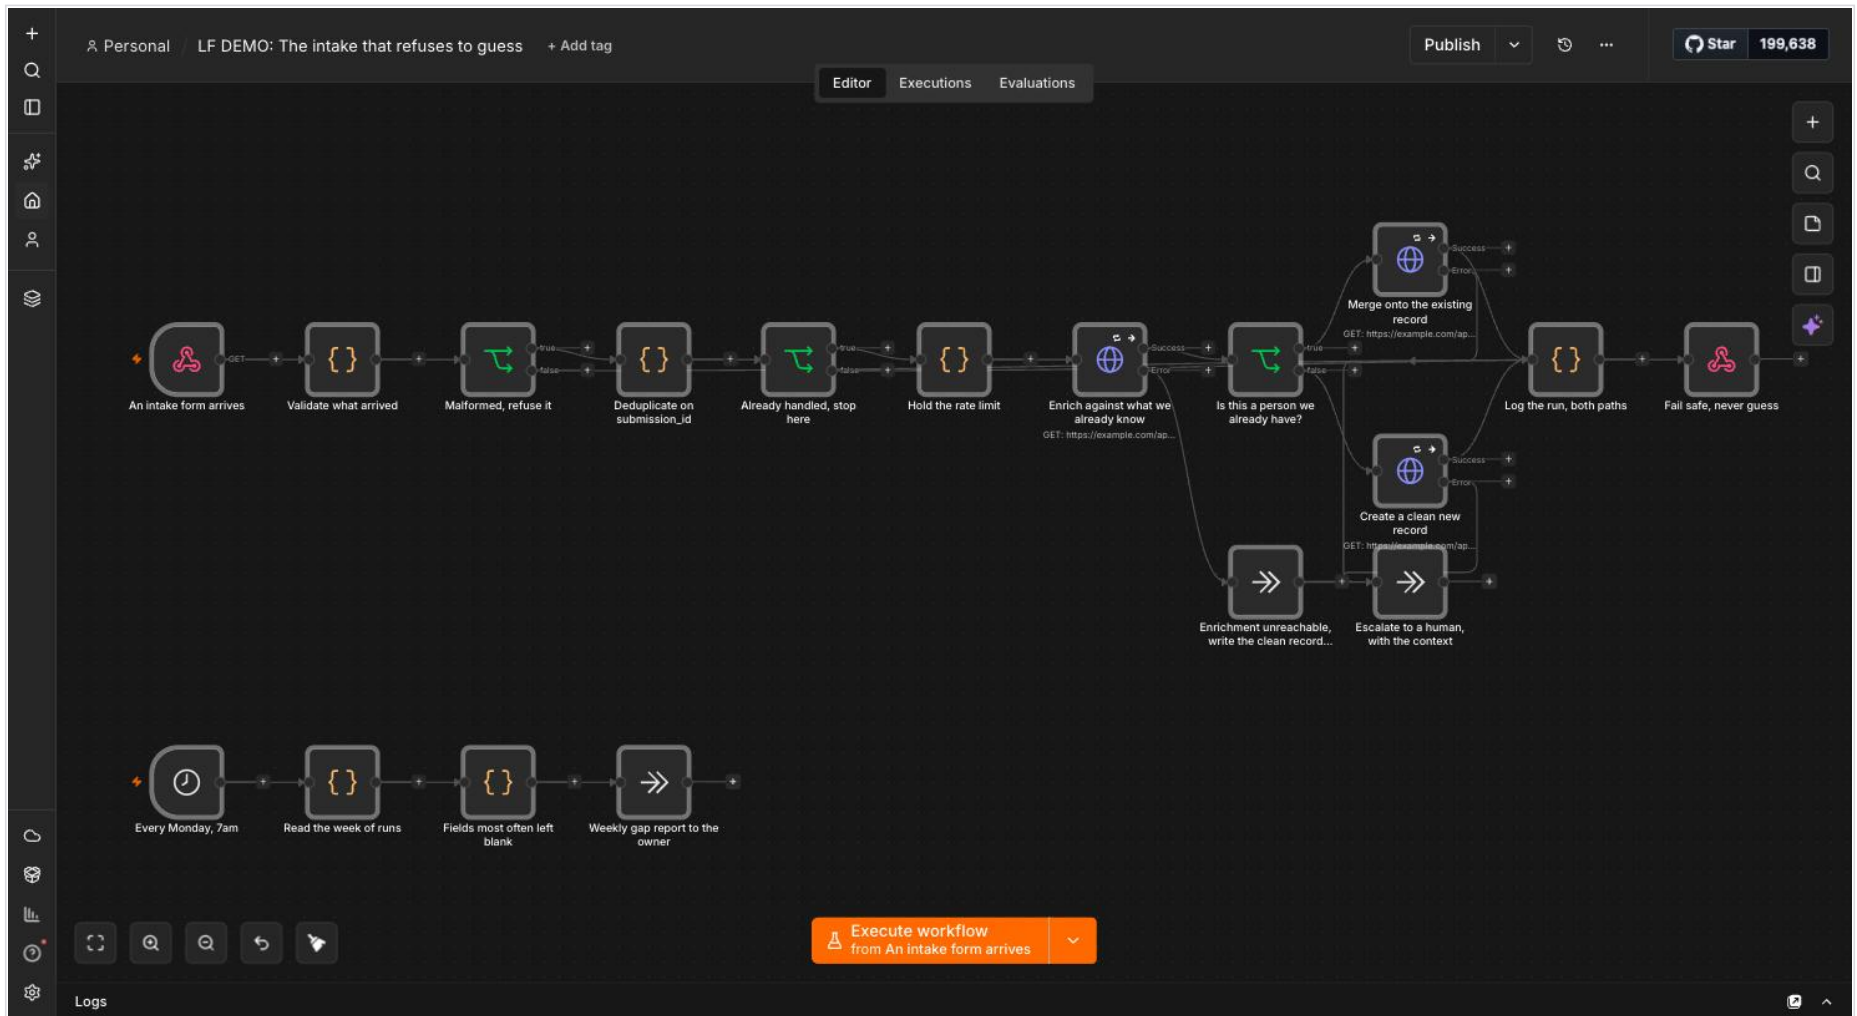

data-collection · built in n8n

A half-record in the CRM is worse than no record, because it looks complete.

What it connects to: The form and the system of record are almost never the same tool. Everything expensive happens in the gap: duplicates, half-records, and fields that mean different things on each side.

1 of 4 SYSTEM

Here's the intake spine: validate, refuse what's malformed, dedupe, then write a clean record.

2 of 4 THINKING

The validation gate is the part that matters — it refuses rather than guessing.

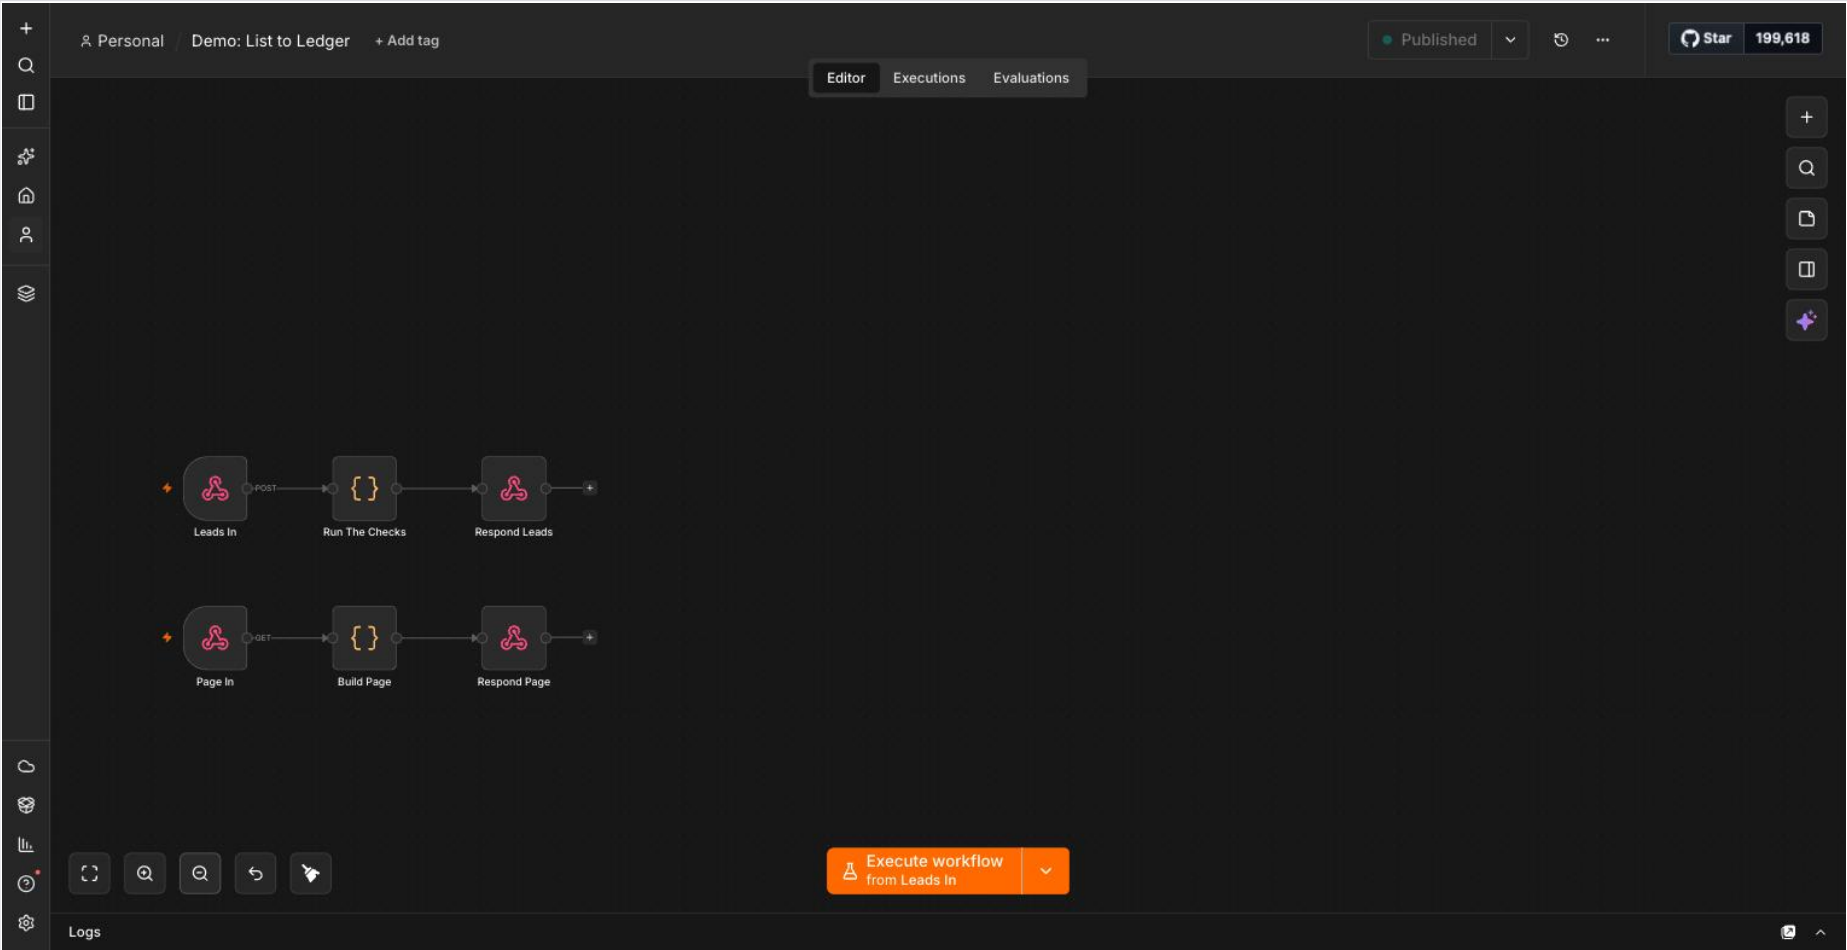

The screenshot displays a workflow editor interface with a dark theme. The main workspace is divided into three vertical panels: INPUT, Parameters/Settings, and OUTPUT.

- INPUT Panel:** Contains the text "No input data" and a button "Execute previous nodes" with the subtitle "to view input data".
- Parameters/Settings Panel:**
 - Has tabs for "Parameters" and "Settings".
 - Contains an "Execute step" button.
 - Under the "Conditions" section, there is a text area with the JSON condition: `{{ $json.existing === true && $json.confidence > 0.8 }}`. To its right is a dropdown menu showing "is true".
 - Below the conditions is a toggle switch labeled "Convert types where required", which is currently turned off.
 - Under the "Options" section, there is a "+ Add option" button.
- OUTPUT Panel:** Contains the text "No output data" and a button "Execute step" with the subtitle "to view output data".

At the bottom of the interface, there is a "Logs" tab and a status bar with the text "I wish this node would..." and a small icon.

3 of 4 THEIR-WORLD

The intake form itself, with real field types bound to CRM properties.

4 of 4 RESULT

And the records it produces, clean and deduplicated.
