

The Migration Build

platform-migration · built in ghl

Migrations lose records quietly. Nobody finds out until the customer who was lost calls.

What it connects to: Migration is two data models arguing. The mapping decision — which field becomes which property — is the entire job; the import is the easy part.

1 of 4 SYSTEM

Here's the migration: reversible batches, counts reconciled before anything commits.

2 of 4 THINKING

If the counts don't match, the batch rolls back and reports the delta instead of half-writing.

The screenshot shows a workflow editor with a central node titled "Do the counts reconcile exactly?". The node has three tabs: "Parameters", "Settings", and "Logs". The "Parameters" tab is active, showing a "Conditions" section with a single condition: `{{ $json.countsMatch === true && $json.sourceCount > 0 }}`. Below the conditions, there is a toggle for "Convert types where required" which is currently turned off. The "Options" section is empty. The "Settings" tab is also visible, showing an "Execute step" button. The "INPUT" panel on the left displays "No input data" and an "Execute previous nodes" button. The "OUTPUT" panel on the right displays "No output data" and an "Execute step" button. The bottom of the interface shows a "Logs" panel.

Do the counts reconcile exactly?

INPUT

Parameters Settings

Execute step

OUTPUT

|→

No output data

Execute step

to view output data

Logs

3 of 4 THEIR-WORLD

A real import with the field mapping resolved.

And the result — records in, associations intact, zero errors.
