

The Operations Board

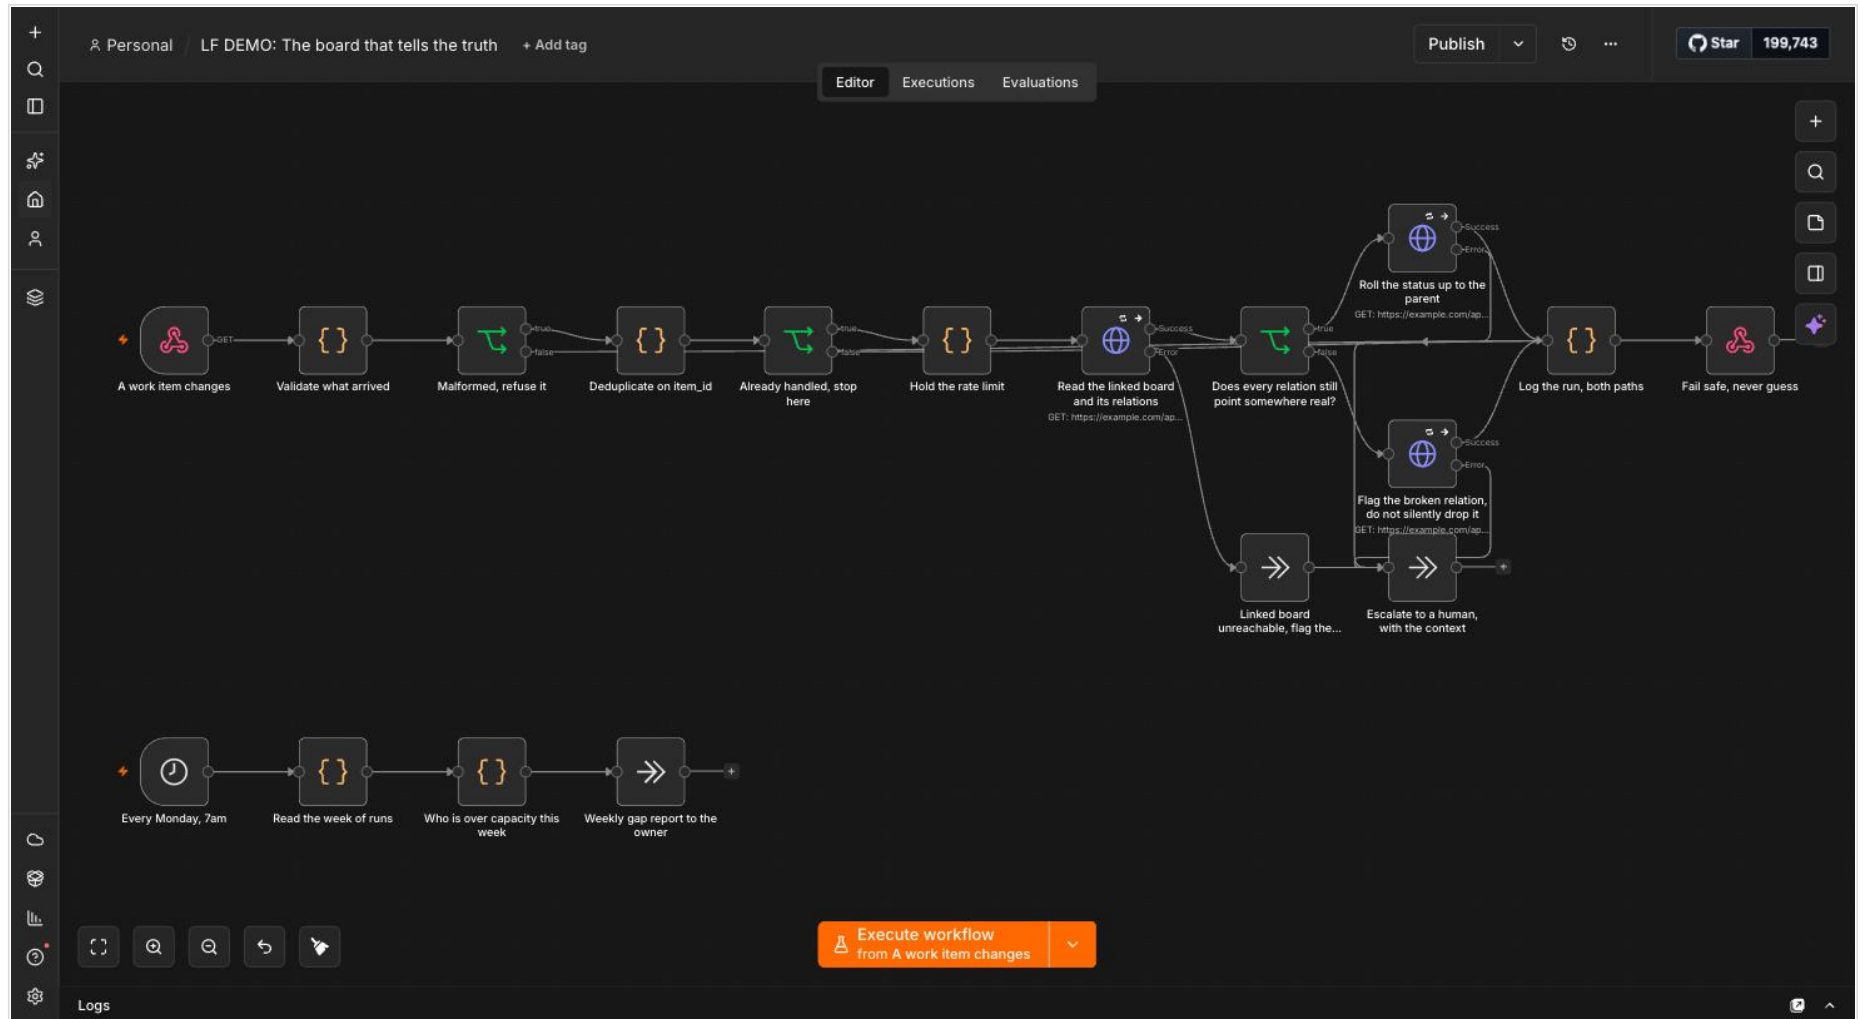

project-ops · built in n8n

Most board problems are architecture problems: relations pointing at dead boards, no templates, and no way to see who is drowning.

What it connects to: The board is downstream of the CRM and upstream of the invoice. Work arriving without its deal context is what makes a board go stale.

1 of 3 SYSTEM

Here's the system that keeps the boards honest — it checks the structure on every change rather than waiting for someone to notice a broken column.

2 of 3 THINKING

This is the gate underneath it: a relation pointing at a board that no longer exists gets flagged, not silently dropped. Silently dropped is how boards rot.

The screenshot shows a dark-themed interface for configuring a data processing step. The title bar at the top reads "Does every relation still point somewhere real?". Below the title bar, there are two tabs: "Parameters" (selected) and "Settings". An orange button labeled "Execute step" is in the top right corner.

The main configuration area is divided into two sections: "Conditions" and "Options".

Conditions:

- A single condition is defined with a JSON expression: `{{ $json.relationsValid === true && $json.board != null }}`. To the right of the expression is a checkbox labeled "is true", which is currently checked.
- Below the condition is a button labeled "+ Add condition".

Options:

- A toggle switch labeled "Convert types where required" is currently turned off.
- Below the toggle is a button labeled "+ Add option".

On the left side of the interface, there is a vertical sidebar with a "No input data" message and a button labeled "Execute previous nodes to view input data".

And the workload view, which is the answer to 'we can't see who's overloaded'.

Who is over capacity this week

```
1 // Who is over capacity this week – the number a manager cannot see by
  eye.
2 const items = Object.values($getWorkflowStaticData('global').open ||
  {});
3 const byOwner = {};
4 for (const i of items) (byOwner[i.owner] ||= []).push(i);
5 const rows = Object.entries(byOwner).map(([owner, list]) => ({
6   owner, open: list.length,
7   overdue: list.filter(i => i.dueAt && i.dueAt < Date.now()).length }));
8 const drowning = rows.filter(r => r.open > 12 || r.overdue > 3);
9 return [{ json: { rows, note: drowning.length
10   ? `${drowning.map(r=>r.owner).join(', ')} are past a sustainable
    load. Rebalance before the dates slip.`
11   : 'Nobody is over capacity this week.' } }];
```

Type \$ for a list of **special vars/methods**. Debug by using `console.log()` statements and viewing their output in the browser console.
